

Truss Jib

Truss Jibs - A truss jib is utilized in order to pick up and place trusses. It is actually an extended jib attachment that is outfitted along with a pyramid or triangular shaped frame. Typically, truss jibs are mounted on machinery like for example a compact telehandler, a skid steer loader or even a forklift making use of a quick-coupler accessory.

Older style cranes that have deep triangular truss jibs are normally assemble and fastened with bolts and rivets into standard open structural shapes. There are rarely any welds on these style jibs. Every bolted or riveted joint is susceptible to rusting and thus needs frequent maintenance and check up.

Truss jibs are built with a back-to-back arrangement of lacing members separated by the width of the flange thickness of an additional structural member. This particular design causes narrow separation amid the flat exteriors of the lacings. There is little room and limited access to clean and preserve them against rusting. A lot of bolts loosen and corrode in their bores and should be changed.
